Replanning

Description

Overview

This scenario focuses on the options available when a limited automatic replan notification is received. The production planner may decide to ignore the message or replan when such an event occurs. In this scenario a single on-demand job has exceeded the replan notification threshold. This scenario investigates both situations. In addition to the replanning options, the replan thresholds may be adjusted as the production planner deems necessary.

Assumptions

- The On-demand request to be processed has already undergone SSI&T
- A replan threshold has been defined and set.
- An active plan and a resource Plan are currently up and running

Replanning

Details

Scenario

The submittal of an on-demand job triggers notification that the on-demand replan notification threshold has been exceeded and a limited automatic replan may be necessary. Two options are available :

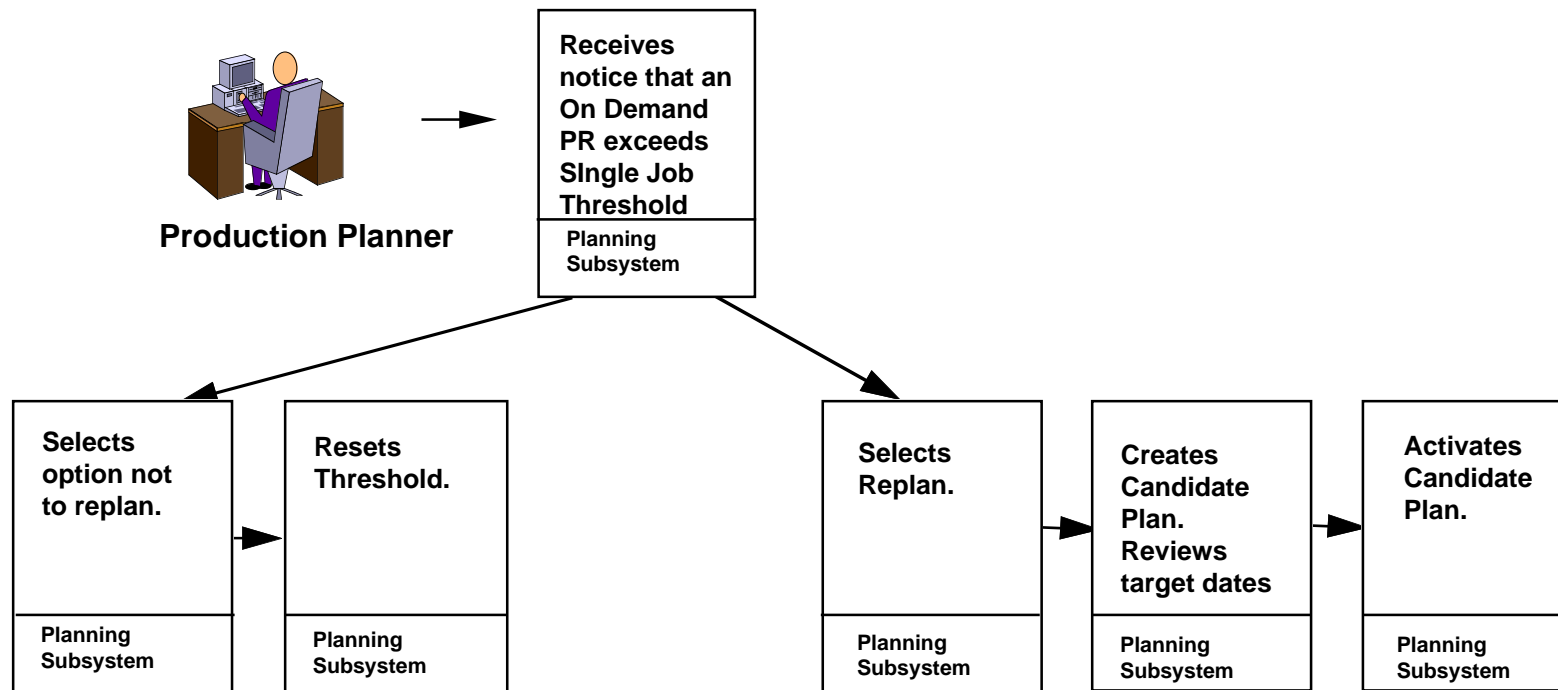

- **Production Planner decides not to replan**
 - Production Planner determines that the default threshold is too low, and adjusts the replan threshold to avoid notification of similar on-demand requests.
- **Production Planner decides to accommodate this request and elects to replan which accesses the workbench to initiate the replan.**
 - Planner selects option to create a candidate plan
 - Candidate plan is produced which includes the on-demand job that initiated the request, along with the accompanying target date estimations for the jobs within the time frame of the plan.
 - Low priority job does not meet its desired target date. Planner decides to activate the new plan anyway.

604 Scenario Heritage

- Many of the features presented here are new
- Operations Concept for the ECS Project: Part 2B - ECS Release B 604-CD-002-002 (Section 4.2.4.3 - On-Demand processing Requests and 4.2.4.5 - Add Hot Job)

Replanning

Functional Flow

Replanning

Points of View- Ignore Replan

Production Planner

Planning Subsystem

- Examines the current on-demand replan threshold requirements for the specified job.
- Determines that the current threshold specified is too low and decides to reset the threshold.
- Closes pop up window and optionally decides to enter the planning workbench and accesses the configuration menu
- Selects option and modifies the existing on-demand replan notification threshold.

- Planning Subsystem notifies the production Planner that an on-demand job has exceeded the single on-demand job replan threshold.

- Planning Subsystem displays the planning workbench

- Planning Subsystem resets the threshold, based on Production Planner specifications.

Replanning

Points of View- Replan due to exceeding threshold

Production Planner

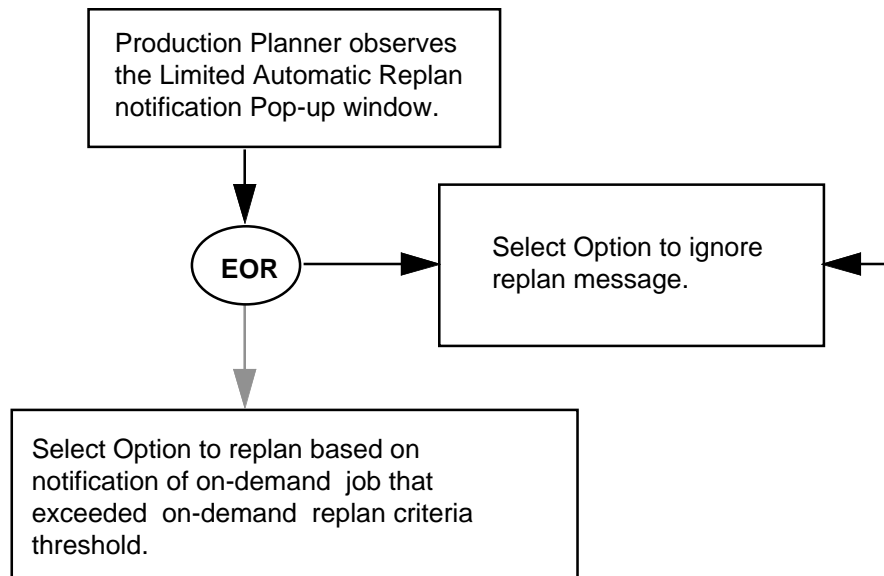

Planning Subsystem

- Examines the current on-demand replan threshold requirements for the specified job.
- Determines that the current threshold specified is sufficient for on-demand production requests and elects to replan.
- Selects option to replan.
- Reviews the plan and target date report generated by the candidate plan, and determines that the target dates for the low priority jobs are not critical to production and selects option to activate the candidate plan.

- Planning Subsystem receives notification of an on-demand request that has exceeded the single on-demand job replan threshold.
- Planning Subsystem displays the planning workbench.
- Planning Subsystem generates a candidate plan.
- Produces a target date report indicating the estimated completion date for production and its relationship to the desired target date
- Planning Subsystem activates the new plan.

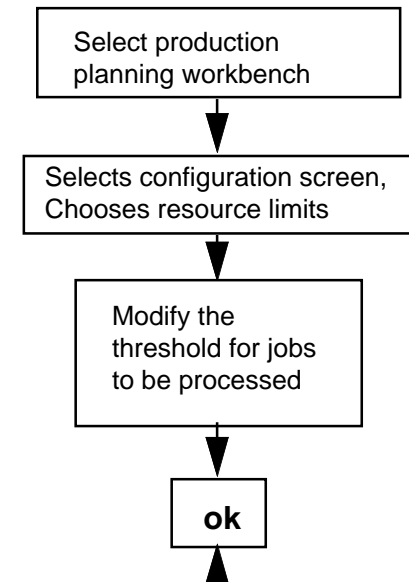

Replanning

Workflow - Ignore Replan

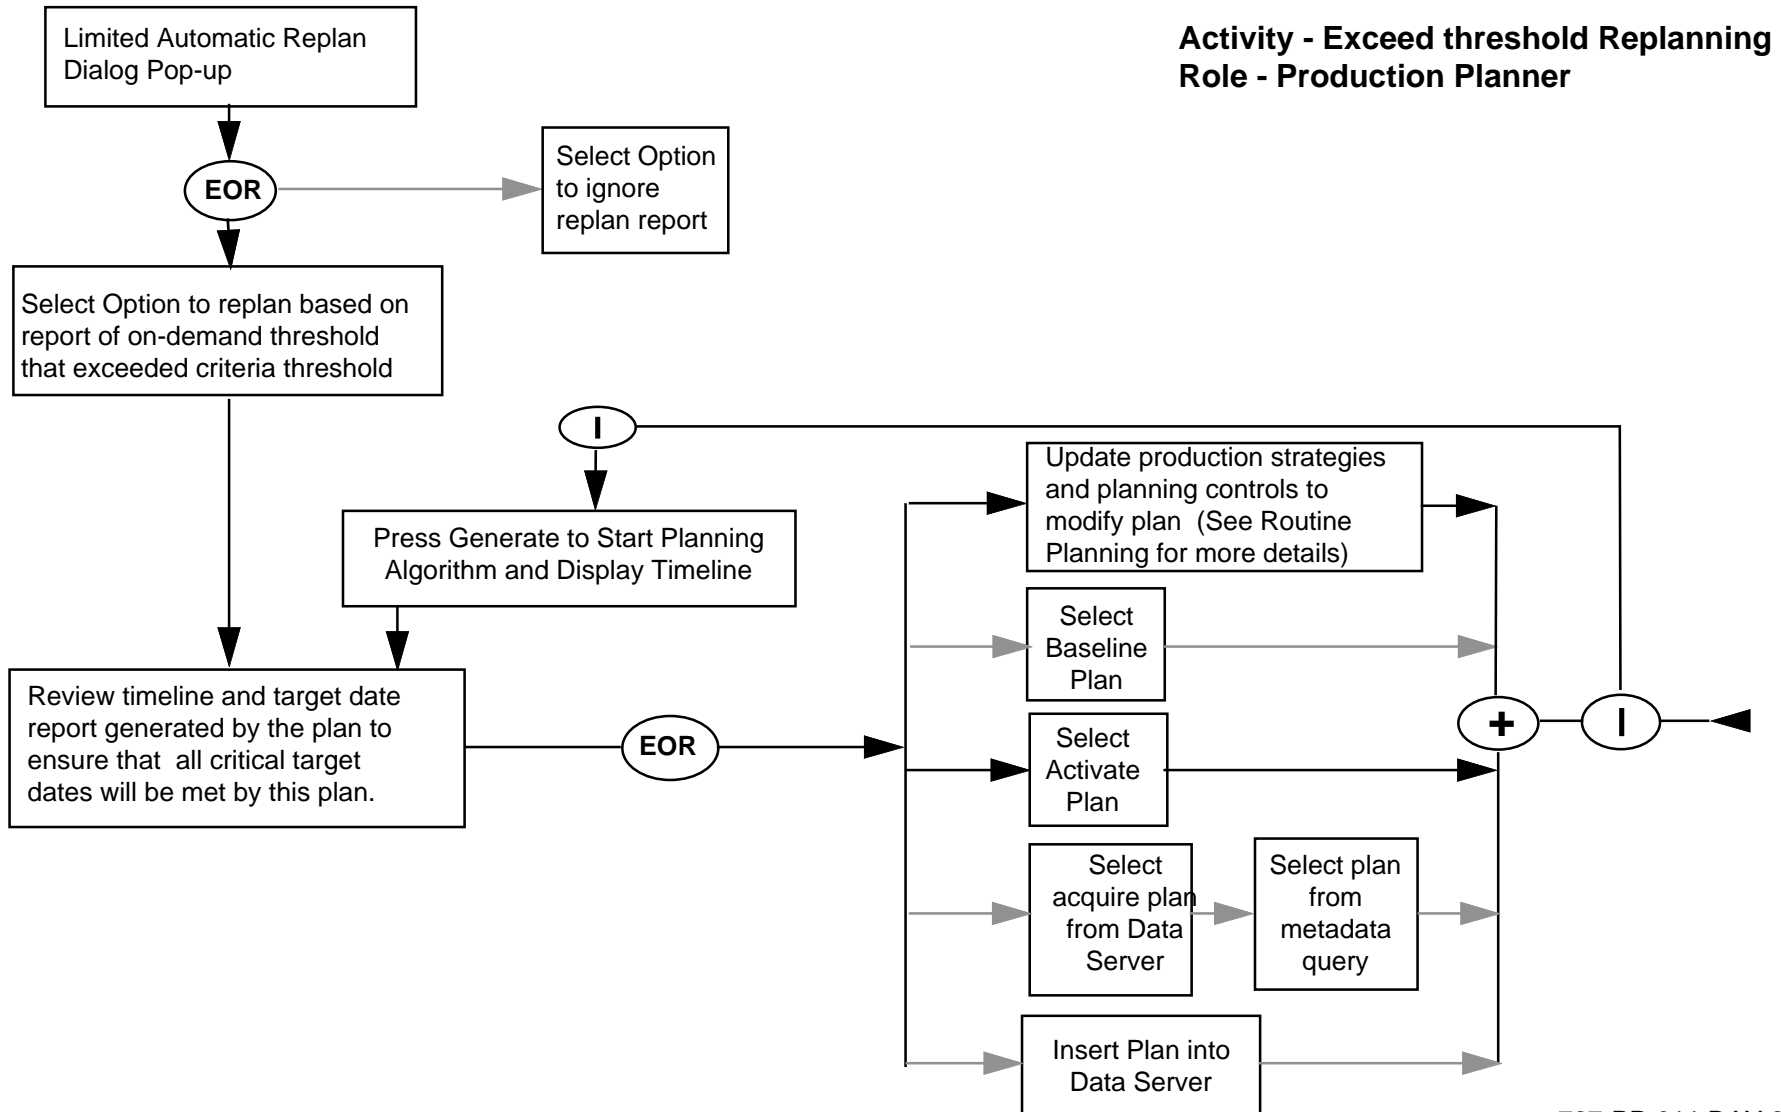

Activity - Ignore Replan

Role - DAAC Production Planner
